TWO FACTOR AUTHENTICATION

Part of the Protect product family

The Service

Two-factor authentication reinforces access security by requiring two methods (also referred to as factors) to verify your identity, just like you would with internet banking.
These factors can include something you know, like a username + password AND something you have like a smartphone app.
This information is then used to approve authentication requests.

2FA protects against phishing, social engineering and password brute-force attacks and secures your logins from attackers exploiting weak or stolen credentials. Traditional two factor solutions do not come with the same amount of reliability and can be difficult to use. Our solution is the easiest, most modern way to protect your data and ensure that time and productivity are not affected.

The Features

Multiple ways to verify (app, one-time pin)

Proactive technical support

Improve end user experience

Verify identity in seconds

Protect any application on any device
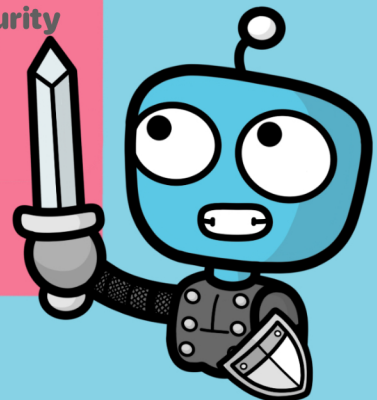

The Benefits

Easy, effective + secure

Quick deploy
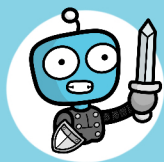

Strong endpoint security

Stronger access security

Protect all data + apps

Increase security + compliance
